- Bootstrap
- JavaScript

- Angular
- React JS
- MySql
- WordPress

Project

Stream analysis for career choice aptitude tests -

The necessity for such an online IQ test emerged primarily because of the current system's shortcomings. Here, the major goal is to provide users with more dynamic and user-friendly software. The IQ test creates a more enjoyable working environment, increases the clarity with which appropriate information is presented to the user, and allows for faster access to and retrieval of data from the database. Questions can be saved and retrieved using this system, eliminating the need to prepare question papers each time. The system verifies the answer by comparing it to the database's predetermined answers. If the candidate receives a high score, the algorithm will switch the queries to expert level and ask questions about the candidate's subject of interest. Admins can add and remove queries from the database. Each user's results are saved in the database, and the system produces a spreadsheet report from them.

Using Technology – HTML / CSS, JavaScript, Java (Servlet and JSP), MySQl
